JAVA PROJECT REPORT ON

SUPERMARKET CHECKOUT AND DISCOUNTS BILLING SYSTEM

Submitted by
PRANESH.M
25BCS044

Under the Guidance of
DR.BOOPALAN SUDARAMOORTHY
Technical Trainer
Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**
APRIL 2026
Semester: II

DECLARATION

I hereby declare that the project entitled "**TASK AND DAILY ACTIVITY MANAGEMENT SYSTEM"** submitted in partial fulfillment of the requirements for the course **Java Programming language** is a **record of my original work** carried out under the guidance of **DR.BOOPALAN SUDARAMOORTHY**, Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.
I have acknowledged all sources of information used in this project wherever applicable.

April 2026

ABSTRACT

The Task and Daily Activity Management System is a Java-based application developed using Swing GUI to help users manage their daily tasks efficiently. The system allows users to add tasks, update their status, and delete tasks as needed.The application uses core Java concepts such as classes and objects, event handling, and table models to manage and display task data. The graphical user interface provides an easy-to-use environment where users can interact with the system.This project helps improve productivity by organizing daily activities and tracking task completion. It demonstrates the practical use of Java programming in developing a real-time application.

1. INTRODUCTION

In today's fast-paced world, managing daily tasks efficiently has become very important. People often rely on manual methods such as writing tasks on paper or remembering them mentally. However, these methods are not reliable and can lead to confusion, missed deadlines, and poor time management.
To overcome these issues, a computerized system is required that can help users organize and track their daily activities. The Task and Daily Activity Management System is developed as a solution to this problem.

This system is implemented using Java programming language and Swing GUI, which provides a simple and interactive interface. Users can easily add new tasks, update their status, and delete tasks when completed.
The system reduces manual effort, improves accuracy, and helps users manage their time effectively. It is especially useful for students and working professionals to keep track of their daily activities.

1.1 Objective

The main objective of this project is to develop a simple and efficient task management system using Java.
The specific objectives are:

- To design a user-friendly graphical interface using Java Swing
- To allow users to add and store daily tasks
- To provide functionality to update task status from Pending to Completed
- To allow users to delete tasks when they are no longer needed
- To reduce manual errors in task management
- To improve productivity and time management
- To implement core Java concepts such as classes, objects, and event handling

1.2 Overview

The Task and Daily Activity Management System is a desktop-based application developed using Java Swing. It provides a graphical user interface where users can interact with the system easily.
The application allows users to enter tasks through a text field and store them in a table format. Each task is displayed along with its status (Pending or Completed).
Users can perform operations such as:

- Adding a new task
- Updating task status
- Deleting tasks

The system uses JTable to display tasks and DefaultTableModel to manage data. Event handling is used to perform actions when buttons are clicked.
Overall, the system provides a simple and efficient way to manage daily tasks.

1.3 Features

The main features of the system include:

1. User-Friendly Interface
   The system provides an easy-to-use graphical interface.
2. Task Addition
   Users can enter and add new tasks.
3. Task Deletion
   Users can remove tasks from the list.
4. Task Status Update
   Tasks can be marked as Completed.
5. Real-Time Display
   Tasks are displayed instantly in a table format.
6. Error Handling
   System shows warning messages for invalid inputs.
7. Simple Design
   The application is lightweight and easy to use.

2.PROGRAM ANALYSIS

Program analysis is the process of understanding the problem and identifying system requirements before development.

2.1 Problem Definition

Managing tasks manually is time-consuming and inefficient. People may forget important tasks or fail to track their progress.

There is a need for a system that can:

- Store tasks
- Track progress
- Provide easy access

2.2 Project Overview

This project is designed to provide a simple solution for managing daily tasks. It uses Java Swing to create a graphical interface where users can interact easily.

The system allows users to:

- Add tasks
- View tasks
- Update task status
- Delete tasks

2.3 Scope and Limitations

Scope:

- Useful for students and professionals
- Helps in organizing daily work
- Improves productivity

Limitations

- Does not store data permanently
- No reminder or notification system
- No multi-user support
- Limited to basic task management

3.SYSTEM DESIGN

System design is the stage where the structure and components of the system are planned before the actual implementation. In this phase, the system is divided into different modules, and the workflow of the application is defined. Proper system design helps in organizing the program efficiently and makes development easier.

System design defines the structure and components of the system.

The system is divided into several modules to perform specific tasks. Each module is responsible for handling a particular function of the system.

3.1 Modules

The main modules of the Supermarket Checkout and Discount Billing System are explained below:

- Task Input Module
- Accepts user input for tasks.
- Task Display Module
- Displays tasks in a table format.
- Status Update Module
- Updates task status to Completed.
- Delete Module
- Removes selected tasks.

.

4.METHODOLOGY

- Problem Analysis
- System Design
- Program Development
- Testing and Validation
- Result and Documentation

4.1. Problem Analysis

Identified the need for a task management system

. 4.2 System Designn

Designed GUI layout and modules.

4.3 Program Development

Implemented using Java Swing and event handling.

4.4 Testing

Tested with different inputs to ensure correctness.

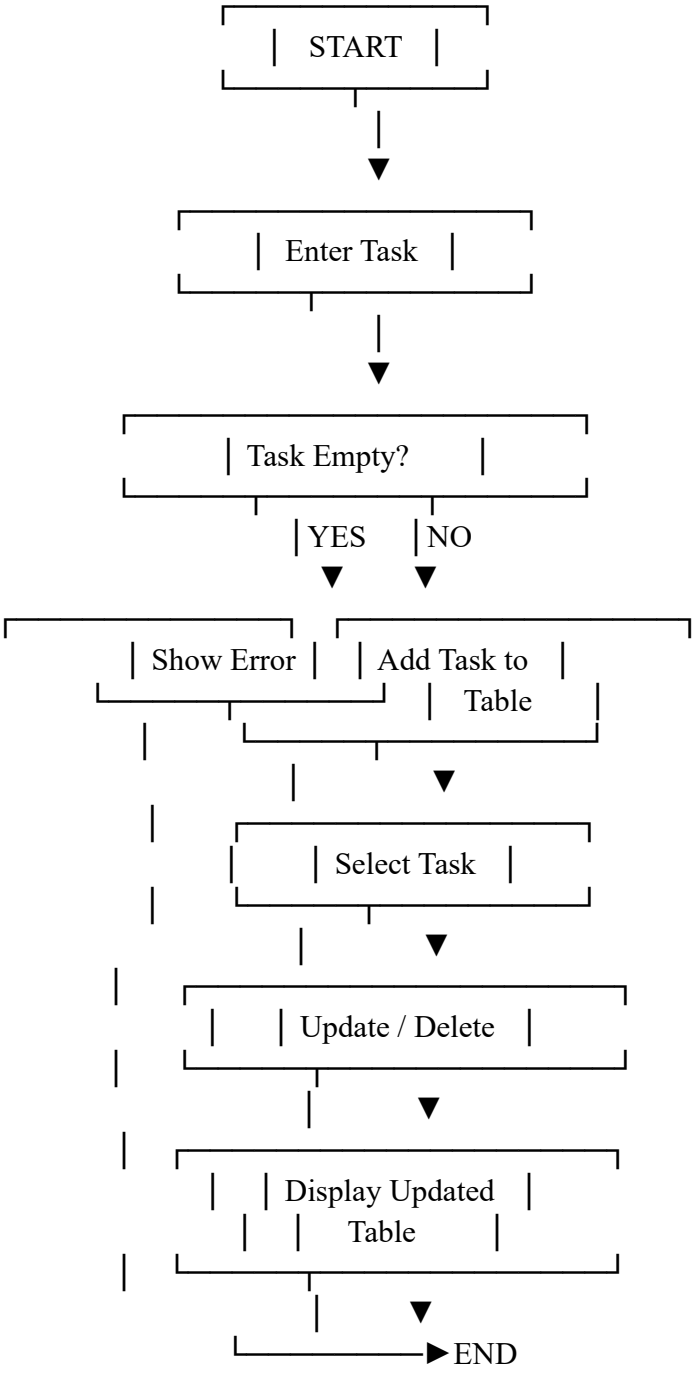

4.5 Result

System works successfully without errors.

4.7. ALGORITHM

- Start the program
- Display GUI
- Enter task
- Check if input is empty
- If empty → show error message
- Else → add task to table
- Select task
- Perform update or delete operation
- Stop the program

4.7. Flowchart

5.SOURCE CODE

```
// Adding Task
String task = taskField.getText();
model.addRow(new Object[]{task, "Pending"});

// Deleting Task
int row = table.getSelectedRow();
model.removeRow(row);

// Marking Task as Completed
model.setValueAt("Completed", row, 1);
```

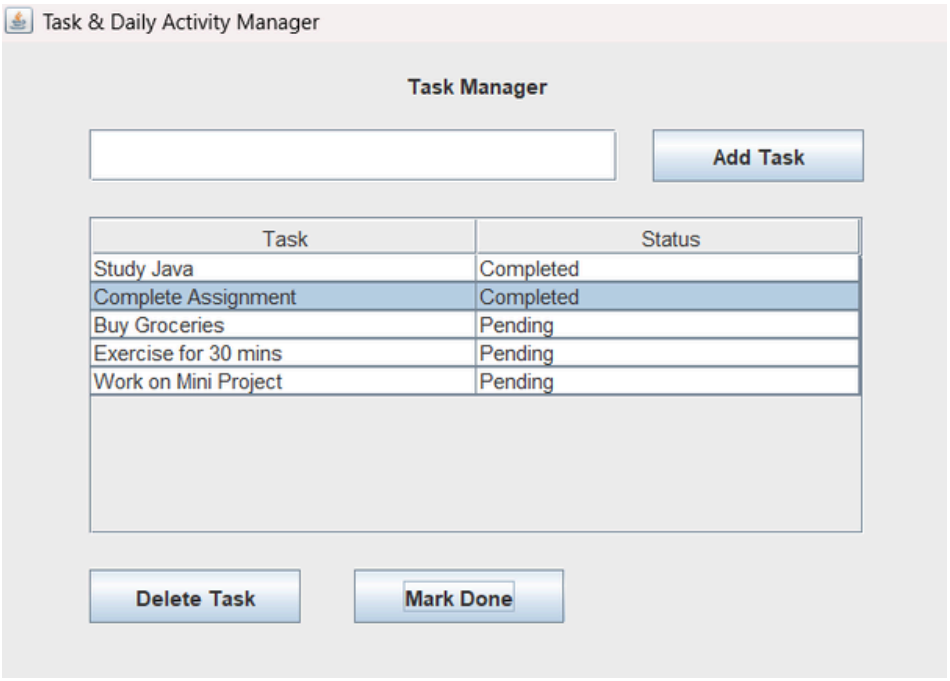

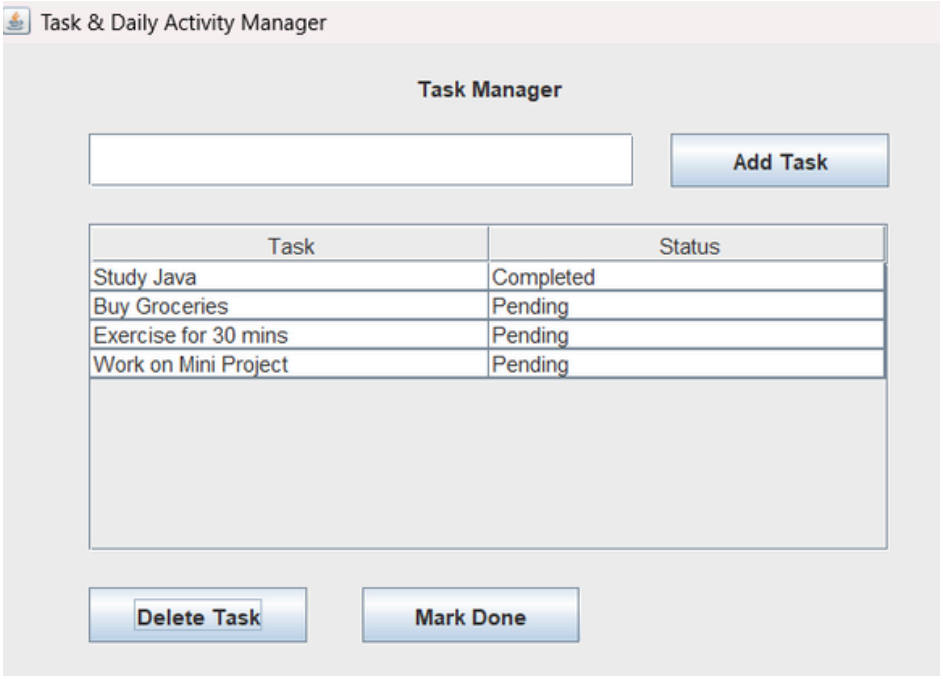

Figure 4: Task Deleted

DISCUSSION & CONCLUSION

7.1 Discussion

The system was developed successfully using Java Swing. It allows users to manage tasks easily using a graphical interface.

The system was tested with different inputs and it performed all operations correctly.

7.2 Conclusion

The Task Management System is a simple and effective application. It helps users organize their daily tasks and improves productivity.
The project demonstrates the practical use of Java programming concepts in real-world applications.
Future improvements can include database storage and reminder features.
